

G27 Pull Request Reliability Review

Version 2 | 5 October 2026 | Code snapshot 558699d

The combined implementation addresses Anna's reported state and source-receipt failures, including main's update03. Recorded reruns preserve the numerical outputs. This page replaces the earlier 127/130-test report; it certifies the named snapshot, not future commits.

Finding	Cause and response
Model state	PR5 advanced state before classification succeeded. PR8 commits state after success and restores model state after a failed batch.
Consumed EEG	Model rollback did not rewind the EEG stream. Updated PR8 makes processing failures terminal; recovery reconstructs the decoder and replays from a known run boundary. Retrying a consumed chunk is rejected.
Combined receipts	PR7/8 integration and then update03 changed sources behind saved receipts. Actual reruns refresh active evidence and preserve historical snapshots. Guards check source/output hashes and prediction correctness.
Evidence labels	Balanced random subsets are retrospective, not chronological calibration. Reports label inspected test reuse, historical checks and the distinct scoring windows.

Verification and independent review

136 tests pass locally and in GitHub CI; preflight and 19 published-result checks pass. Training replay preserves 3,840 predictions, 192 summaries and six 80-trial raw runs. Organizer reruns preserve three CSVs and 12 input hashes.

The requested Astra/Ultra review is recorded as completed; actual runtime identity is unverified. A completed read-only review verified **Claude Fable 5.1 at Max** on 558699d, with no blocking code or provenance finding. Its medium report-freshness finding is corrected here. Smaller hardening suggestions are recorded in the companion.

Scientific results and limits

Organizer-style CSP: fixed +3.5 s **358/480**; one pooled peak **407/480**; sum of six separately selected session peaks **427/480**. Peak times were selected after seeing test results. Offline 433/480 baseline and exploratory Riemannian 446/480 use a different scoring contract.

Early training-tail selection remains **75/120 versus fixed CSP 82/120**. There is no independent accuracy improvement, motor-intent or rehabilitation claim. Actual FES onset, clinical side and physical channel geometry remain unconfirmed.

Integration and delivery

Anna merged PR6 into main on 5 October 2026. It includes PR5, PR7, PR8 and PR9; GitHub also marks PR5/7/9 merged. PR8 remains open although its commits are included. This report update is a separate documentation change. Video/submission remain team outcomes.

Evidence: results/pr_reliability/verification.json (current_stack_checks), report_snapshot.json, and docs/pr_reliability_review.md. Anna's update03 request. Workflow applies to PRs containing it, pushes to main/codex/pr-reliability, and enabled merge groups. CI does not rerun raw EEG.
